

Deaths per case vs % aged 65+

Expected = Poisson model with onset-month effects and $\log(\text{cases})$ offset. Point area proportional to cases in the wave. Line: Poisson fit, drawn from the 1st to 99th percentile of % aged 65+. Diamonds: pooled observed / expected in 10 equal-count bins, 95% CIs from 1,000 bootstrap resamples of counties. y-axis: up to the 99th percentile.
